

## Ceramic Denibbing Tool

A denibbing tool is a fast and effective way to remove paint and clear coat imperfections without the need for respraying. In some cases, tungsten denibbing tools are used, but these can be too aggressive. Ceramic denibbing tools are designed to be less aggressive and more forgiving on the surrounding clear coat, helping to prevent deep scratches that may occur with a tungsten blade.

### Additional Information

- Effortless defect removal: The tool allows you to quickly & easily shave off protruding paint defects such as dust nips, runs, sags, & overspray without significant effort.
- Minimal surface marring: Designed for above-surface defect removal, the ceramic blade glides over the affected area & shaves only the protrusion, minimising the risk of scratching or damaging the surrounding paintwork.
- Ceramic blades are exceptionally hard (up to 10 times harder than steel blades), ensuring a long-lasting cutting edge & consistent performance over time.
- The tool is suitable for use on a wide variety of painted surfaces, including car body panels, furniture, motorhomes, caravans, & other domestic items, making it a versatile addition to any detailer's or painter's kit. Recommended for use with shim-masks, please see Part No. 92439.
- Supplied complete with carry cord & plastic storage case.
